## Evaluation of the principal stress values and directions using 8, 7, and 6 independent strain values.

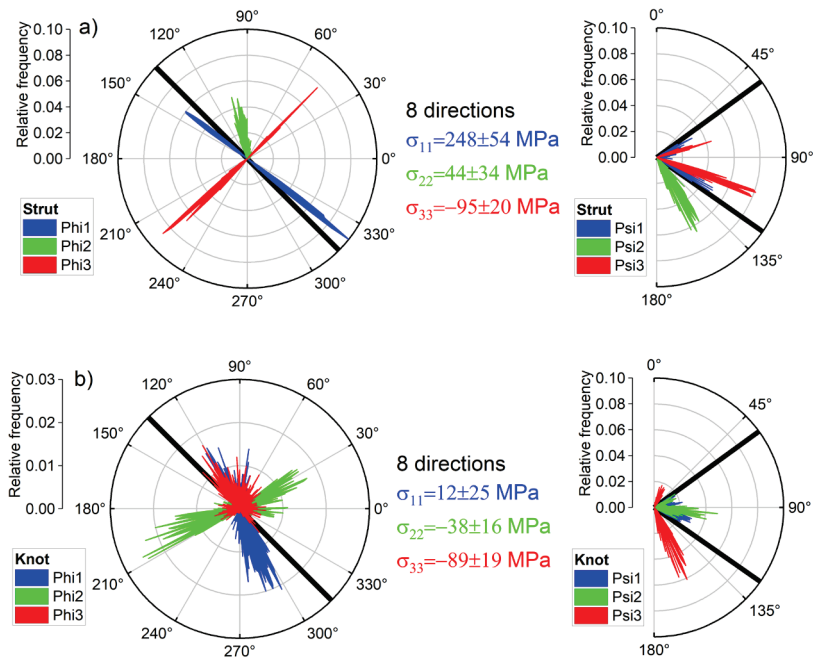

Figure S1: The results of the principal direction estimation for a) the strut and b) the knot in the central unit cell (UC) of the lattice structure in the sample coordinate system: the eigenvalues  $\sigma_{ii}$  (middle) as well as the azimuthal angle  $\phi_i^S$  (left) and the polar angle  $\psi_i^S$  (right) of the corresponding eigenvector (blue, green, red) are shown. Each color bar represents a principal stress component. These results are presented for directions '1-8' (see Figure 1d)

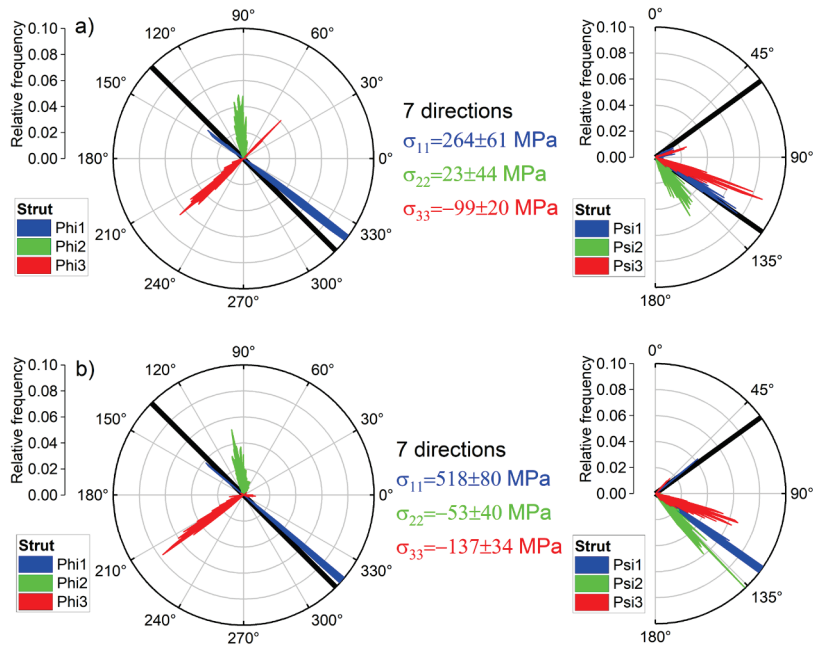

Figure S2: The results of the principal direction estimation for the strut in the central UC of the lattice structure in the sample coordinate system: the eigenvalues  $\sigma_{ii}$  (middle) as well as the azimuthal  $\phi_i^S$  (left) and polar  $\psi_i^S$  (right) angles of the corresponding eigenvector are shown. Each color bar represents a principal stress component. These results are presented for a) directions '1-7' (see Figure 1d) and b) the seven directions with the lowest  $\mu$ strain value ('1-3, 5-6, 8-9').

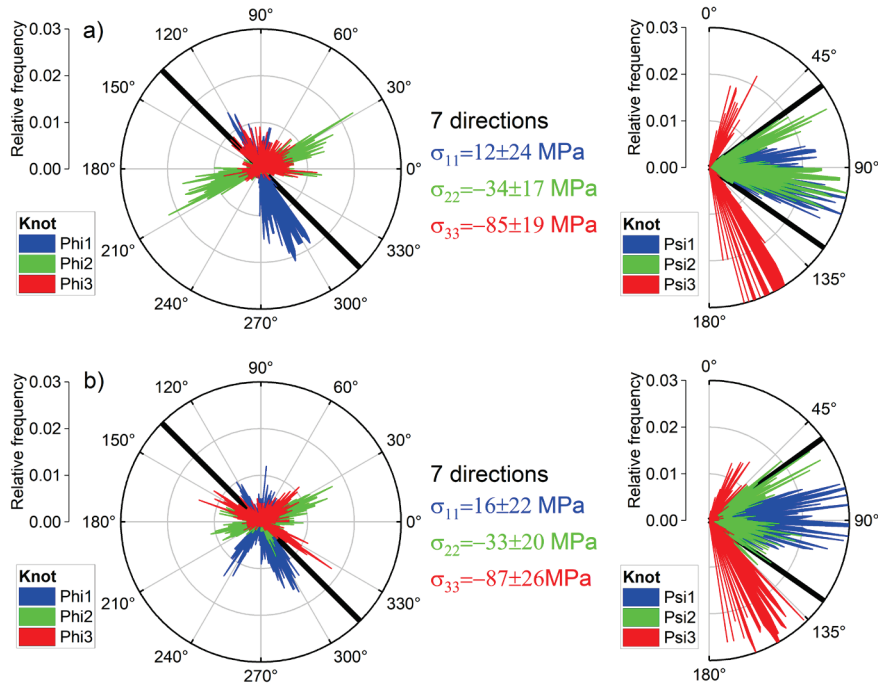

Figure S3: The results of the principal direction estimation for the knot in the central UC of the lattice structure in the sample coordinate system: the eigenvalues  $\sigma_{ii}$  (middle) as well as the azimuthal  $\phi_i^S$  (left) and polar  $\psi_i^S$  (right) angles of the corresponding eigenvector are shown. Each color bar represents a principal stress component. These results are presented for a) directions '1-7' (see Figure 1d) and b) the seven directions with the lowest  $\mu$ strain value ('1-3, 5-6, 8-9').

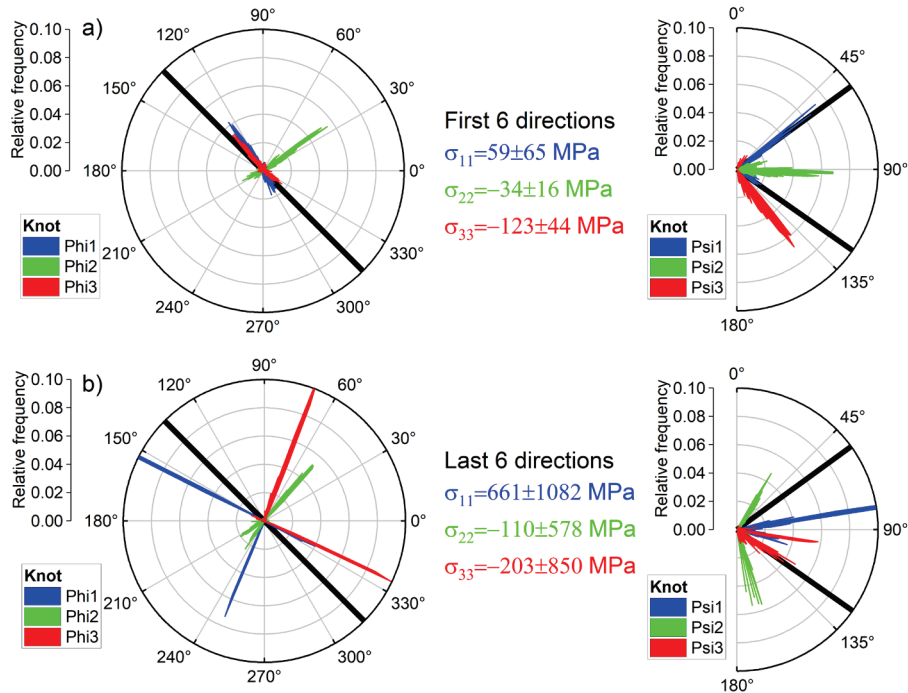

Figure S4: The results of the principal direction calculation for the knot position using only six measurements: using the directions a) '1-6' and b) '4-9' (see the sample coordinate system in Figure 1d). The eigenvalues  $\sigma_{ii}$  (middle), the azimuthal angle  $\phi_i^S$  (left), and the polar angle  $\psi_i^S$  (right) of the corresponding eigenvector (blue, green, red) are shown.

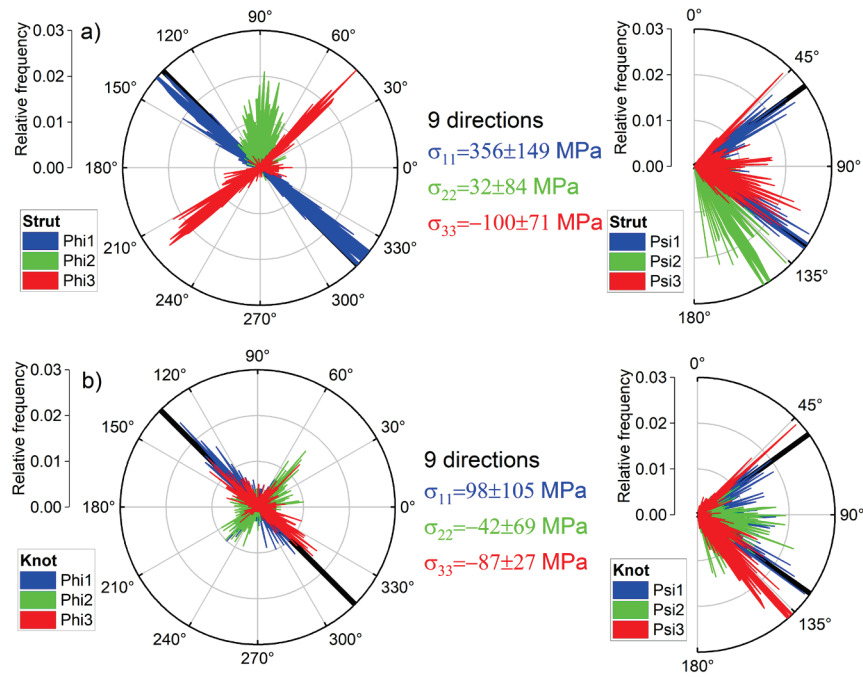

Figure S5: The calculated principal direction for a) the strut and b) the knot in the sample coordinate system: the eigenvalues  $\sigma_{ii}$  (middle), the azimuthal angle  $\phi_i^S$  (left), and the polar angle  $\psi_i^S$  (right) of the corresponding eigenvector (blue, green, red) under the assumption of an artificial error of 500  $\mu$ strain on every measured strain value. This is to compare with Figure 2a.
