Additional file 1 - Variation of the element composition of municipal sewage sludges in the context of new regulations on phosphorus recovery in Germany

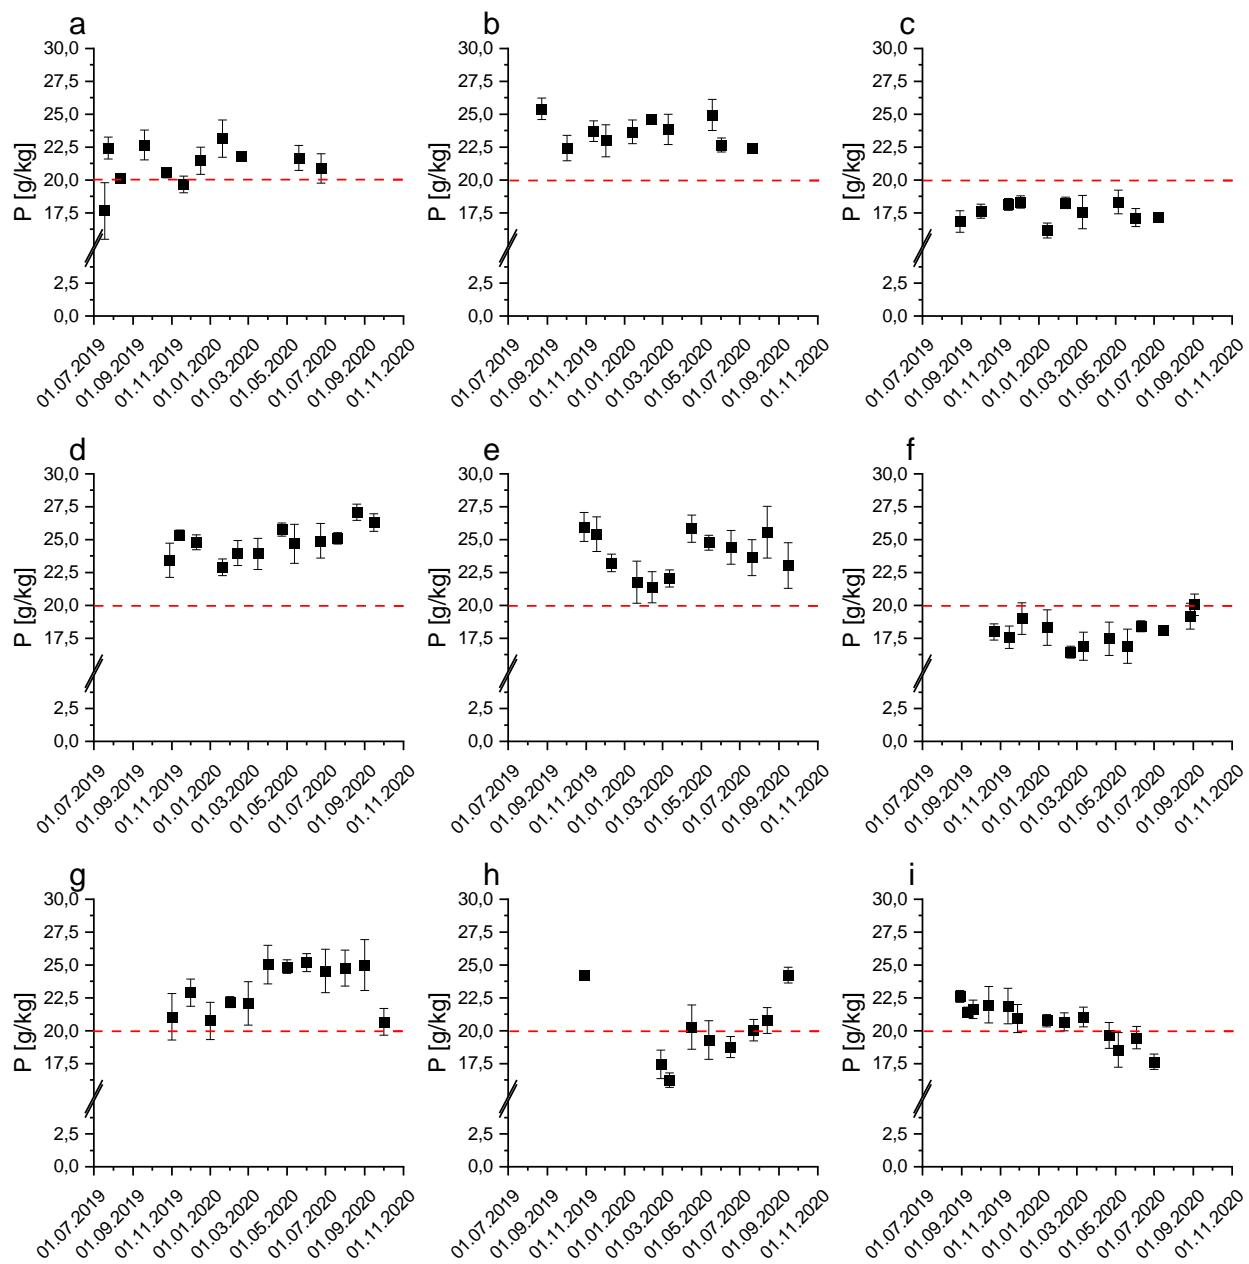

Figure S1: Phosphorus content variations (dry matter) in municipal sewage sludge at 9 WWTPs

The error bars in Figure S1 are shown based on the P measurement standard deviation between the duplicates (ICP-OES) and the standard deviation of the moisture analysis (triplicates). The ICP-OES coefficients of variation (RSD_{OES}) for all duplicates was at maximum 6%, average 2%. However, moisture contents showed higher differences with RSD_{moist} up to 11%, average 3%. In general, further replicates were done in case of $RSDs > 5\%$ but due to the need of higher masses more replicates were not possible for the moisture analysis for all samples. All monthly values for the phosphorus content are also shown in Table S2, S4, S6, S8, S10, S12, S14, S16 and S18 (6th row).

Additional file 1 - Variation of the element composition of municipal sewage sludges in the context of new regulations on phosphorus recovery in Germany

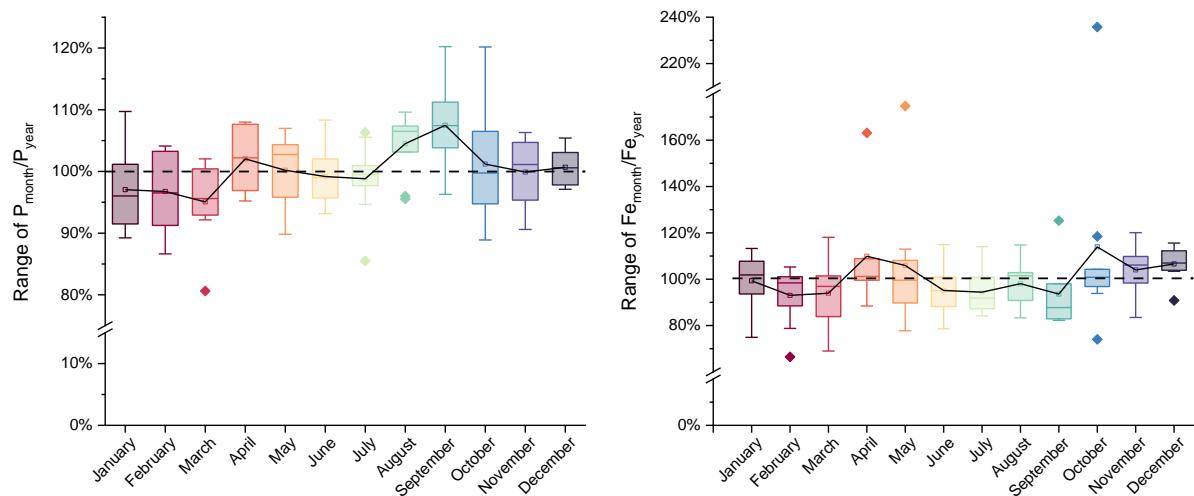

Figure S2: Range of monthly phosphorus and iron content by annual mean during the year

Phosphorus variations from the annual mean are also shown in table S2, S4, S6, S8, S10, S12, S14, S16 and S18 (7th row)

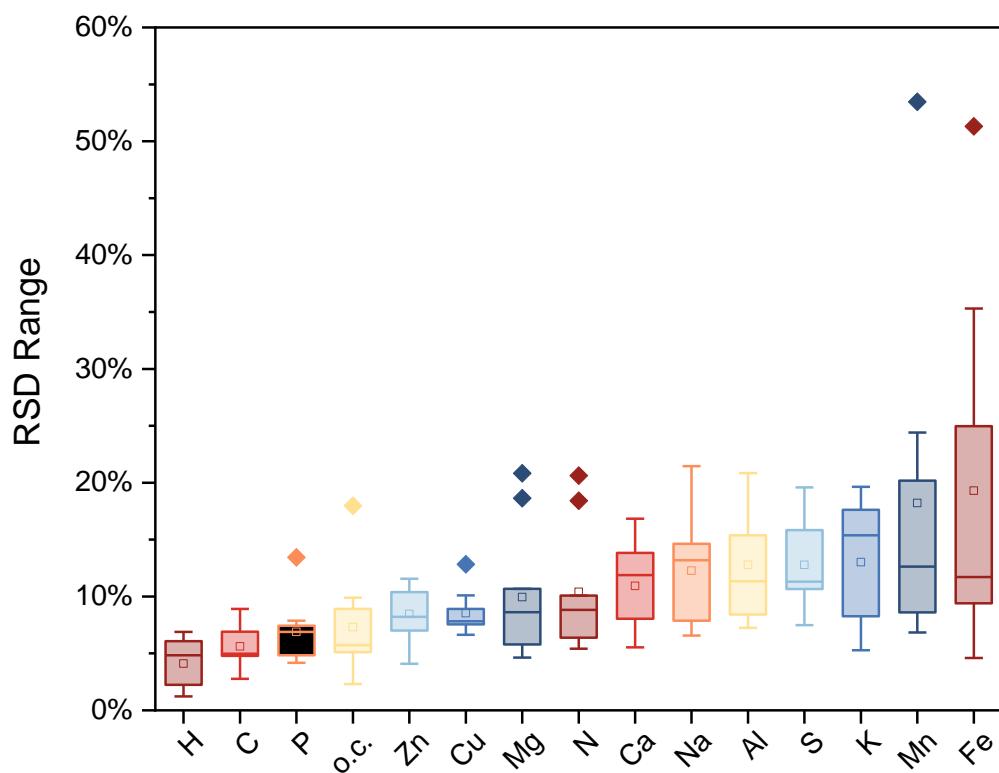

Figure S3: Ranges of relative standard deviation (RSD) of matrix elements and organic content for the 9 WWTPs over the whole year

RSDs were formed by analysis of monthly sewage sludge samples from 9 WWTPs a to i.

All annual RSDs (also trace elements) are shown in table S2, S4, S6, S8, S10, S12, S14, S16 and S18 (last column)
